

FROM TIRE BUFFING DUST TO FINISHED PRODUCTS

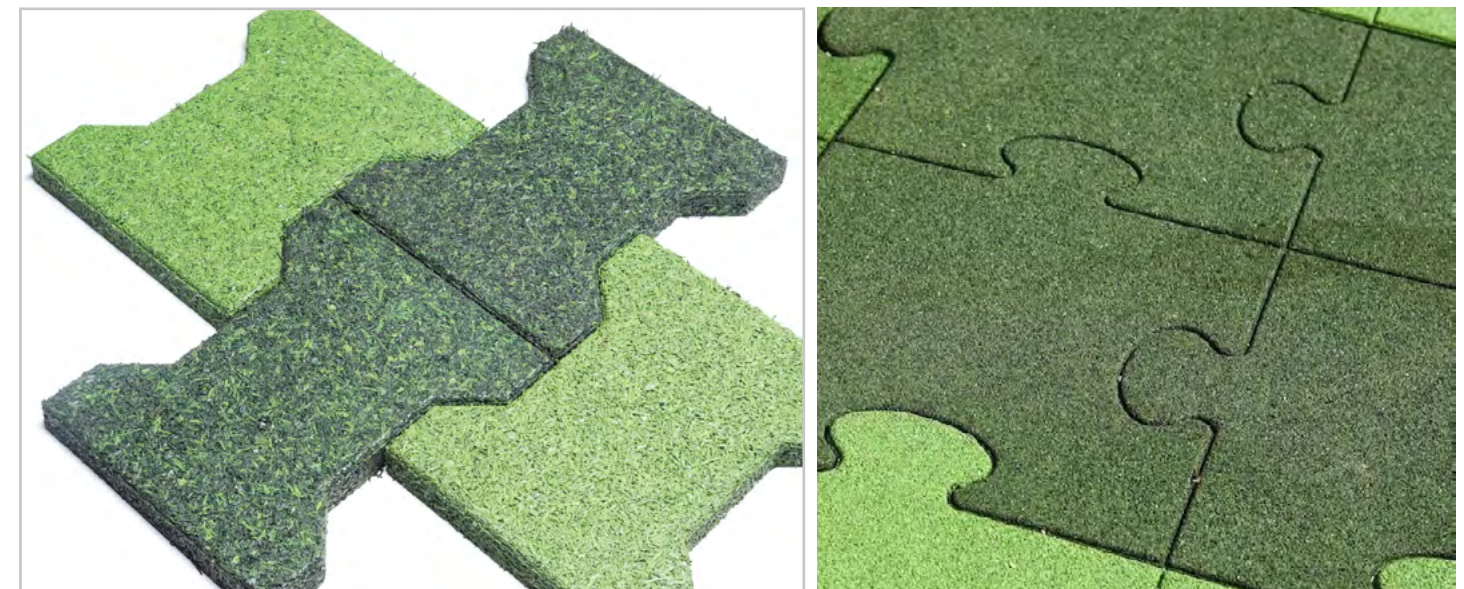

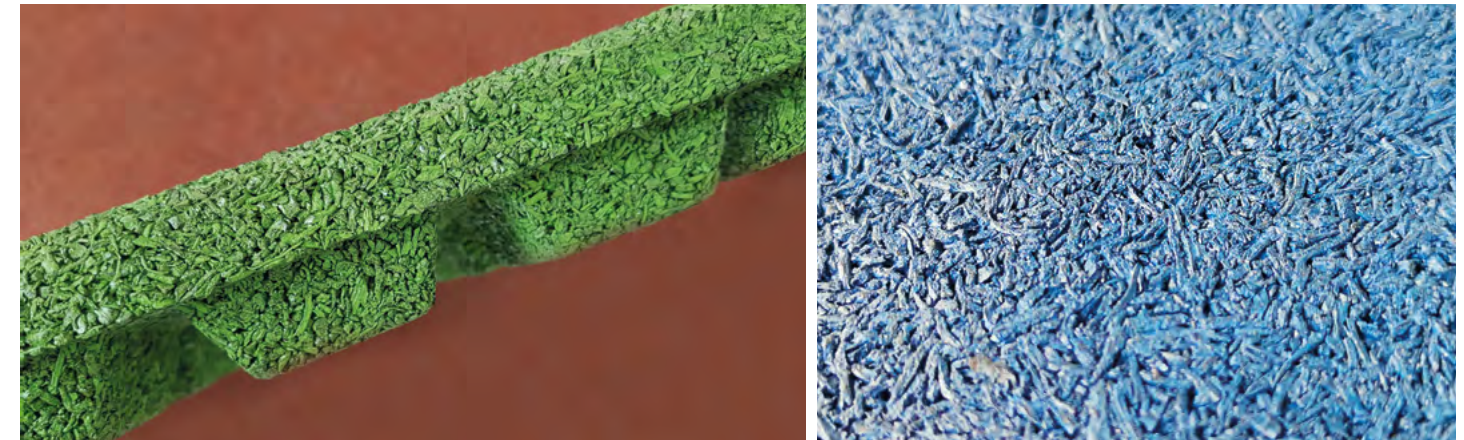

It allows to convert buffing material or rubber granules into decorative products for gardens, public parks, street furniture and design articles. It is also suitable for crumb coloring to be used as pellets for the infill of football fields with artificial turf.

Starting from buffing material from waste tyres or from the retreading process, it produces shock-proof paving, residential and industrial flooring, interlocking paving, livestock tiles and much more, by simply adding molds of different shapes.
